# INFORMED SEARCH ALGORITHMS

## CHAPTER 4, SECTIONS 1–2

# Outline

- ◇ Best-first search
- ◇ A\* search
- ◇ Heuristics

## Review: Tree search

```
function TREE-SEARCH(problem, fringe) returns a solution, or failure
  fringe ← INSERT(MAKE-NODE(INITIAL-STATE[problem]), fringe)
  loop do
    if fringe is empty then return failure
    node ← REMOVE-FRONT(fringe)
    if GOAL-TEST[problem] applied to STATE(node) succeeds return node
    fringe ← INSERTALL(EXPAND(node, problem), fringe)
```

A strategy is defined by picking the **order of node expansion**

## Best-first search

**Idea:** use an **evaluation function** for each node  
– estimate of “desirability”

⇒ Expand most desirable unexpanded node

**Implementation:**

*fringe* is a queue sorted in decreasing order of desirability

Special cases:

greedy search

A\* search

## Greedy search

Evaluation function  $h(n)$  (**h**euristic)

= estimate of cost from  $n$  to the closest goal

E.g.,  $h_{\text{SLD}}(n)$  = straight-line distance from  $n$  to Bucharest

Greedy search expands the node that **appears** to be closest to goal

# Greedy search example

# Greedy search example

# Greedy search example

# Greedy search example

# Properties of greedy search

Complete??

## Properties of greedy search

Complete?? No—can get stuck in loops, e.g., with Oradea as goal,

Iasi  $\rightarrow$  Neamt  $\rightarrow$  Iasi  $\rightarrow$  Neamt  $\rightarrow$

Complete in finite space with repeated-state checking

Time??

## Properties of greedy search

Complete?? No—can get stuck in loops, e.g.,

lasi → Neamt → lasi → Neamt →

Complete in finite space with repeated-state checking

Time??  $O(b^m)$ , but a good heuristic can give dramatic improvement

Space??

## Properties of greedy search

Complete?? No—can get stuck in loops, e.g.,

lasi → Neamt → lasi → Neamt →

Complete in finite space with repeated-state checking

Time??  $O(b^m)$ , but a good heuristic can give dramatic improvement

Space??  $O(b^m)$ —keeps all nodes in memory

Optimal??

## Properties of greedy search

Complete?? No—can get stuck in loops, e.g.,

lasi → Neamt → lasi → Neamt →

Complete in finite space with repeated-state checking

Time??  $O(b^m)$ , but a good heuristic can give dramatic improvement

Space??  $O(b^m)$ —keeps all nodes in memory

Optimal?? No

## A\* search

Idea: avoid expanding paths that are already expensive

Evaluation function  $f(n) = g(n) + h(n)$

$g(n)$  = cost so far to reach  $n$

$h(n)$  = estimated cost to goal from  $n$

$f(n)$  = estimated total cost of path through  $n$  to goal

A\* search uses an **admissible** heuristic

i.e.,  $h(n) \leq h^*(n)$  where  $h^*(n)$  is the **true** cost from  $n$ .

(Also require  $h(n) \geq 0$ , so  $h(G) = 0$  for any goal  $G$ .)

E.g.,  $h_{\text{SLD}}(n)$  never overestimates the actual road distance

**Theorem:** A\* search is optimal

# A\* search example

▶ Arad  
 $366=0+366$

# A\* search example

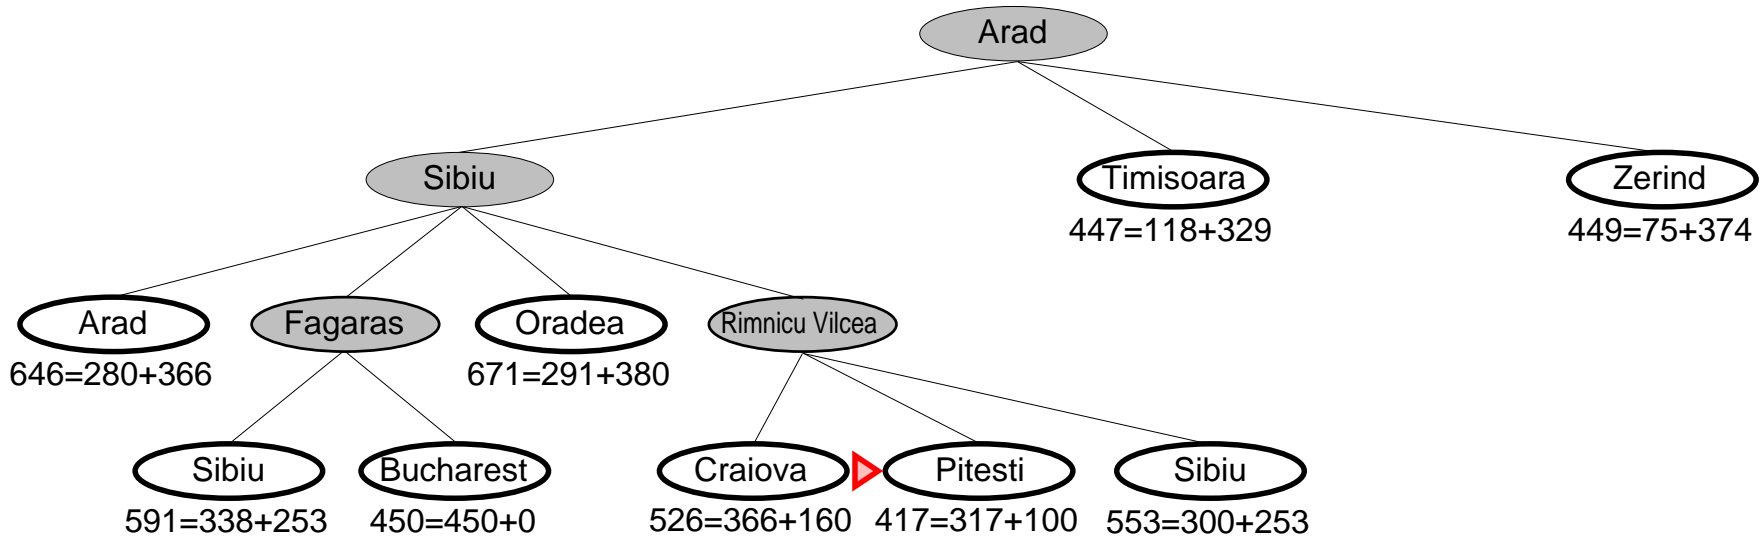

# A\* search example

# A\* search example

# A\* search example

# A\* search example

## Optimality of A\* (standard proof)

Suppose some suboptimal goal  $G_2$  has been generated and is in the queue. Let  $n$  be an unexpanded node on a shortest path to an optimal goal  $G_1$ .

$$\begin{aligned} f(G_2) &= g(G_2) && \text{since } h(G_2) = 0 \\ &> g(G_1) && \text{since } G_2 \text{ is suboptimal} \\ &\geq f(n) && \text{since } h \text{ is admissible} \end{aligned}$$

Since  $f(G_2) > f(n)$ , A\* will never select  $G_2$  for expansion

# Optimality of A\* (more useful)

**Lemma:** A\* expands nodes in order of increasing  $f$  value\*

Gradually adds “ $f$ -contours” of nodes (cf. breadth-first adds layers)

Contour  $i$  has all nodes with  $f = f_i$ , where  $f_i < f_{i+1}$

# Properties of $A^*$

Complete??

## Properties of $A^*$

Complete?? Yes, unless there are infinitely many nodes with  $f \leq f(G)$

Time??

## Properties of A\*

Complete?? Yes, unless there are infinitely many nodes with  $f \leq f(G)$

Time?? Exponential in [relative error in  $h \times$  length of soln.]

Space??

## Properties of $A^*$

Complete?? Yes, unless there are infinitely many nodes with  $f \leq f(G)$

Time?? Exponential in [relative error in  $h \times$  length of soln.]

Space?? Keeps all nodes in memory

Optimal??

## Properties of A\*

Complete?? Yes, unless there are infinitely many nodes with  $f \leq f(G)$

Time?? Exponential in [relative error in  $h \times$  length of soln.]

Space?? Keeps all nodes in memory

Optimal?? Yes—cannot expand  $f_{i+1}$  until  $f_i$  is finished

A\* expands all nodes with  $f(n) < C^*$

A\* expands some nodes with  $f(n) = C^*$

A\* expands no nodes with  $f(n) > C^*$

## Proof of lemma: Consistency

A heuristic is **consistent** if

$$h(n) \leq c(n, a, n') + h(n')$$

If  $h$  is consistent, we have

$$\begin{aligned} f(n') &= g(n') + h(n') \\ &= g(n) + c(n, a, n') + h(n') \\ &\geq g(n) + h(n) \\ &= f(n) \end{aligned}$$

I.e.,  $f(n)$  is nondecreasing along any path.

# Admissible heuristics

E.g., for the 8-puzzle:

$h_1(n)$  = number of misplaced tiles

$h_2(n)$  = total Manhattan distance

(i.e., no. of squares from desired location of each tile)

|   |   |   |
|---|---|---|
| 7 | 2 | 4 |
| 5 |   | 6 |
| 8 | 3 | 1 |

Start State

|   |   |   |
|---|---|---|
| 1 | 2 | 3 |
| 4 | 5 | 6 |
| 7 | 8 |   |

Goal State

$h_1(S) = ??$

$h_2(S) = ??$

# Admissible heuristics

E.g., for the 8-puzzle:

$h_1(n)$  = number of misplaced tiles

$h_2(n)$  = total **Manhattan** distance

(i.e., no. of squares from desired location of each tile)

|   |   |   |
|---|---|---|
| 7 | 2 | 4 |
| 5 |   | 6 |
| 8 | 3 | 1 |

Start State

|   |   |   |
|---|---|---|
| 1 | 2 | 3 |
| 4 | 5 | 6 |
| 7 | 8 |   |

Goal State

$h_1(S) = ??$  6

$h_2(S) = ??$   $4+0+3+3+1+0+2+1 = 14$

## Dominance

If  $h_2(n) \geq h_1(n)$  for all  $n$  (both admissible)  
then  $h_2$  dominates  $h_1$  and is better for search

Typical search costs:

$d = 14$  IDS = 3,473,941 nodes

$A^*(h_1) = 539$  nodes

$A^*(h_2) = 113$  nodes

$d = 24$  IDS  $\approx$  54,000,000,000 nodes

$A^*(h_1) = 39,135$  nodes

$A^*(h_2) = 1,641$  nodes

Given any admissible heuristics  $h_a, h_b$ ,

$$h(n) = \max(h_a(n), h_b(n))$$

is also admissible and dominates  $h_a, h_b$

## Relaxed problems

Admissible heuristics can be derived from the **exact** solution cost of a **relaxed** version of the problem

If the rules of the 8-puzzle are relaxed so that a tile can move **anywhere**, then  $h_1(n)$  gives the shortest solution

If the rules are relaxed so that a tile can move to **any adjacent square**, then  $h_2(n)$  gives the shortest solution

Key point: the optimal solution cost of a relaxed problem is no greater than the optimal solution cost of the real problem

## Relaxed problems contd.

Well-known example: [travelling salesperson problem](#) (TSP)

Find the shortest tour visiting all cities exactly once

[Minimum spanning tree](#) can be computed in  $O(n^2)$   
and is a lower bound on the shortest (open) tour

## Summary

Heuristic functions estimate costs of shortest paths

Good heuristics can dramatically reduce search cost

Greedy best-first search expands lowest  $h$

- incomplete and not always optimal

A\* search expands lowest  $g + h$

- complete and optimal
- also optimally efficient (up to tie-breaks, for forward search)

Admissible heuristics can be derived from exact solution of relaxed problems
